Abstract (en)

[origin: WO2012022600A1] The invention relates to a method for determining a travel height of a working machine, in which the height between a position along an approximately perpendicular movement axis of a travel element (2) of the working machine (1) with respect to a reference point is measured. In order always to output a correct travel height despite tyre wear occurring on the wheel of the working machine, the reference point is formed by the ground (3).
