Abstract (en)
[origin: WO2012022441A1] The invention relates to a textile machine (1), in particular a bobbin winder, having a multiplicity of workstations (2) with functional means for carrying out operating functions, means (44, 45, 15) for monitoring the production process during the production and means (54, 47) which are configured for determining a deviation from a desired production process. According to the invention, sequences can be carried out at a workstation (2) for automatically checking functional means, and means (41) are configured for triggering previously fixed sequences as a function of the determined deviations, for automatically checking at least one functional means of a workstation (2) in the case of a production interruption, wherein there are display means (51) and means (60) for transmitting the result of the check to the display means, and the result of the check can be read off on the display means (51).
