Abstract (en)
[origin: WO2012022393A2] The invention relates to an insulating element for insulating facades, which is defined by two substantially planar main surfaces extending approximately parallel to one another and by an edge which connects the main surfaces to one another and which at least partially surrounds the insulating element, comprising at least one duct which passes through the insulating element and which is arranged at least partially between the main surfaces, the width of which duct, in a direction extending perpendicular to the longitudinal axis thereof and parallel to the main surfaces, is greater than the height thereof in a direction extending perpendicular to the main surfaces, characterized in that two inner wall regions of the duct that lie opposite one another in a direction extending perpendicular to the main surfaces are interconnected via a stabilizing arrangement.
