Abstract (en)

[origin: EP2607970A1] The method involves statically balancing a mobile body (1) so as to bring the center of gravity onto an axis (D), and determining a target value for a resulting imbalance moment of the mobile body about the axis. The mobile body is rotated about the axis of the mobile body at a predetermined speed, and the resulting imbalance moment of the mobile body relative to the axis is measured. A value of the imbalance moment of the mobile body about the axis is adjusted to within a given predetermined tolerance relative to the target value. Independent claims are also included for the following: (1) a mobile body for a scientific instrument (2) a mobile assembly for a scientific instrument.
