Abstract (en)
[origin: WO2012025594A1] The invention relates to a lightweight component/layer element which comprises at least two layers and in which at least one first layer is a structured shell and the first layer is joined to a second smooth and/or structured shell at least in some regions lying above one another, wherein the first shell has reinforcing elements, in particular having a honeycomb (hexagonal) basic geometry, surrounded by bars. The invention further relates to the use of the lightweight component/layer element, preferably in bodywork construction, and to the method for producing same.
