Abstract (en)
Provided is a car device for an elevator, which can realize a desired state of a clearance between door panels and walls parts around a doorway with high accuracy and ease. A car device (1) for an elevator includes: door panels (3a, 3b) for opening/closing a doorway (23) to a cage (21); a driving mechanism (5) for driving the door panels so that the door panels are opened/closed; and a doorframe (7) for supporting the door panels and the driving mechanism. The door frame is a single-piece frame including: a support portion (17) for supporting the door panels and the driving mechanism; and a top-plate portion (19) located above the doorway.
