Abstract (en)
[origin: EP2614898A1] The system has electrostatic devices (20, 21) placed opposite and on both sides of a substrate (3) covered with spangles (5), where devices contain electricity conducting surfaces. A charge device ensures generation of a variable electric potential on each surface, so that the surfaces on both sides of the substrate alternatively create electric polarity of a zone (Z) of the substrate and/or of the spangles on the zone. A cleaning device cleans one of the surfaces in displacement with respect to the electrostatic device. A recovery tank recovers the spangles sensitive to electric fields. The cleaning device is a movable scraper. Independent claims are also included for the following: (1) a method for recovery of spangles, sensitive to electric fields, deposited uniformly on a substrate (2) a viscous material jet numerical machine for installation of a viscous material pattern on a face of a substrate.
