Abstract (en)
[origin: EP2615227A2] The identification signal transmitter (1) has an emergency key (6) for mechanical unlocking of a door of the motor vehicle. A primary locking mechanism interacting with the emergency key is provided for locking the emergency key in locked position in a housing. An eyelet component (7) is coupled with the emergency key, which is movable against the emergency key. The eyelet component is brought into coupling position with a secondary locking mechanism when the emergency key is in locking position. The secondary locking mechanism locks the movement of eyelet component against the emergency key.
