Abstract (en)
A housing for a hearing aid, comprising an outer surface adapted to face away from the ear of a user and a shell together defining an elongated cavity for receiving one or more hearing aid components, the shell defining an elongated outer periphery having first and second ends defining the longitudinal extend of the shell, and a circumferential portion of the outer periphery surrounding a longitudinal center line; the shell comprising: a shell section and a lid section, the shell section comprising first and second circumferential end parts of the circumferential portion of the outer periphery, each circumferential end part defining one of the first and second ends and completely surrounding the center line; the shell section further comprising a central part only partially surrounding the center line so as to define a lateral aperture of the shell section for inserting the one or more components into the cavity, the aperture being delimited in the longitudinal direction by the first and second circumferential end parts.
