Abstract (en)
[origin: WO2012034705A1] The invention relates to an oil system for supplying lubricating oil to a working machine and/or drive machine, in particular a steam engine, which is operated with a liquid or vaporous working medium, comprising an oil return connected to the working machine and/or drive machine in order to return oil conducted out of the working machine and/or drive machine and/or out of the working medium into the working machine and/or drive machine, a separating device connected to the oil return for separating working medium contained in the oil returned in the oil return. The separating device has a heating device for heating the returned oil. The invention is characterized in that the heating device for heating the returned oil is supplied with heat from the working medium and/or with heat by means of which the liquid or vaporous working medium is also heated in order to operate the working machine and/or drive machine.
