Abstract (en)

[origin: US2012066767A1] An approach is presented for providing communication with a service using a recipient identifier. The data communication platform receives a request to generate a recipient identifier for indicating data exchanged between a service and an application on a device. Further, the data communication platform determines user identifier, one or more device identifiers associated with the device, one or more application identifiers associated with the application, or a combination thereof. Then, the data communication platform determines to generate the recipient identifier by encoding, at least in part, the user identifier, the one or more device identifiers, the one or more application identifiers, or a combination thereof in the recipient identifier. In one embodiment, the recipient identifier may be encrypted. The user identifier, the one or more device identifiers, the one or more application identifiers, or a combination thereof are decodable directly from the recipient identifier.
