Abstract (en)
[origin: EP2617926A2] The slide rail arrangement (1) has a slide rail (2), a sliding block movable in the slide rail in a longitudinal direction (3), and a locking unit for locking and releasing the linear motion of the sliding block. A bar (4) is connected with a sliding element at one end. The sliding block has a coupling element (7) for connecting the two sections (5,6) of the sliding block. The coupling element (7) is formed such that the latter section has a rotational degree of freedom relative to the former section to avoid unrecognition of the latter section in the slide rail. An independent claim is included for a door operator with an output shaft.
