Abstract (en)

[origin: WO2012038062A1] The invention proposes a device for adjusting the inclination of a movable furniture part, having a front part, relative to a basic furniture structure, on which the movable furniture part is accommodated via a guide unit (9), and the movable furniture part is supported on the guide unit in contact with a bearing element (2) of the adjusting device (1), wherein the guide unit comprises a basic-structure unit, which acts on the basic furniture structure, and a furniture-part unit (9), which can be connected to the movable furniture part, and wherein the adjusting device (1) is presented between the movable furniture part and the guide unit such that, depending on the setting of the adjusting device (1), it is possible to predetermine the inclination of the movable furniture part relative to the basic furniture structure in that the bearing element (2) can be moved into different positions relative to the guide unit. The invention provides a displacement element, which can be displaced along the guide unit, and the bearing element (2) is supported on the displacement element such that, by displacement along the guide unit, the bearing element (2), over an oblique or curved path, shifts the height position relative to the guide unit.
