Abstract (en)

[origin: WO2012038299A2] The invention relates to a method for operating a classification yard (10) for rail-bound traffic, wherein at least rolling resistance information is determined for classification runs (90, 100) involving rolling cars or car groups in at least one track section of the classification yard (10), and, taking into account the determined rolling resistance information and at least reference rolling resistance information which is specific for the respective track section, the rolling resistance of the respective classification run (90, 100) is predicted in at least one subsequent track section of the classification yard (10). The invention further comprises a control device for a classification yard (10).
