Abstract (en)

[origin: US2012070107A1] A flexible sealed bag and method of making thereof; the flexible bag containing a plurality of at least partially water soluble unit dose articles comprises a front panel, a back panel and a bottom panel. The front panel and the back panel may be marginally joined together along at least two opposed edges to be in a confronting relationship to form the closed bag. The front and back panels are joined at the top of the bag by a frangible seal. The bottom panel is intermediate to the front panel and back panel, and is joined to each of them. The first panel comprises at least one transparent window and at least one opaque portion. The articles are distributed from the bottom of the bag to a height therein, providing an empty space above the height of the articles, whereby the transparent window intercepts the articles and the empty space.
