Abstract (en)  
[origin: EP2620583A2] The lift/turning support structure (10) has a locking device that is provided with an axially and radially movable locking element which is rotated with a turning disc portion (42) in order to block the turn disc portion in an intermediate position between the end positions. A stationary locking element (36) is connected with the movable locking element in a freely selectable angle position of the turning disc portion. Several detent portions (110) are distributed over the circumference of the movable and the stationary locking elements.
