Abstract (en)  
[origin: WO2012041622A1] The invention relates to a roof ridge-sealing strip which can be rolled up and comprises a centre strip (5), which can be secured to a roof lath (1), and, disposed either side of the centre strip (5), side strips (6) of which the edge regions (6), which can be bent and extended, adapt to the undulating form of the roofing panels (2) in a position of use as a result of a force which develops as the centre strip (5) is secured to the roof lath (1). According to the invention, in order to improve the roof ridge-sealing strip such that it is easier to handle, a hinge connection (8, 9) is provided between the centre strip (5) and side strips (6) about which hinge connection the side strip (6) can pivot from a packaging position, in which the roof ridge strip can be rolled up into a roll, into the position of use. During the pivoting movement, a retaining member (10) comes into operation in order to prevent the side strip (6) from pivoting back into the packaging position.
