Abstract (en)
[origin: GB2483919A] A portable door lock comprises an elongate member 1 having at one end thereof a wedge portion 2 for engaging the underside of a door and a flat portion 3 freely slidable beneath the door. Separable jacking means 12, 8 co-operate with the flat portion to lift the free end of the flat portion, thereby jamming the elongate member under the door to prevent opening thereof. Locking means 7 selectively prevent release of the jacking means when it has been operated to lift the free end of the flat portion. The locking means may comprise a padlock engaging a loop (Fig 3). The jacking means may comprise a screw 12 engageable with a threaded hole passing through the flat portion 3. The wedge end may have an adjusting screw 5 with rubber faced foot 6. Teeth may be provided on the bottom of the bridging component 8 to engage with the floor or a projecting pin 21 may engage with a hole in the floor 22.
