Abstract (en)

[origin: WO2012113504A1] Proposed are a compressed air maintenance unit (2) and a consumer control device (1) equipped with the same, wherein the compressed air maintenance unit (2) has an activation valve (14) with 3/3-way valve functionality. By means of the activation valve (14), an outlet duct (22) leading to a consumer device (A) can inter alia be selectively supplied with compressed air or decoupled from the compressed-air supply. By means of a pressure sensor (24) and/or a throughflow sensor (25), it is possible for current information regarding the pressure and/or the throughflow to be recorded and compared with reference information previously stored in a teaching mode. As a function of the result of the comparison, it is possible for an electrical diagnostic signal to be generated such that it is possible inter alia for leakage or excessive air consumption in the consumer device (A) to be monitored.
