Abstract (en)

[origin: WO2012041432A1] The invention relates to a carrier explosive body (1) for receiving sub-bodies (5), characterised by a predominantly spherical shape, consisting of a shell (2), into and/or through which sub-bodies (5) project, and a core (3), which is used to receive at least the sub-bodies (5). To this end, the shell (2) has a plurality of holes (4) for receiving the sub-bodies (5). The shell (2) is preferably formed by a hollow sphere. The core (3) also has a plurality of holes (7) for receiving or holding the sub-bodies (5). In particular the core (3) has an opening or passage (12) for receiving the fuses and the delay(s), which are functionally connected to the sub-bodies (5) by means of connections (8). A means (10) incorporated at the interface to the core (3) causes the respective sub-body (5) to be driven out of the holder (7) in the core (3).
