Abstract (en)

[origin: EP2622991A1] The lumbar support (1) has a frame (4) including a recess (5) provided with two opposite bearing devices (6), where the frame is connected to anchoring extensions (7) for releasable anchoring of a backrest. A supporting device (8) is rotatable relative to the frame about a longitudinal axis (9) by the bearing devices. The anchoring projections are formed for height adjustment of the lumbar support on the backrest. The supporting device and the recess are dimensioned such that the supporting device is arranged within the recess. An independent claim is also included for a method for adjusting a lumbar support for a backrest of a chair.
