Abstract (en)
[origin: EP2624275A1] The switch (10) has a motor drive (30) including a control switch (50), which enables manual operation of the drive in a switching position (M) and remote control of the drive by a remote control activation signal (SR) and a converting signal (SU) at control signal inputs (60, 70) of the drive in another switching position (R). The drive includes control devices e.g. microprocessors, which allow a remote controlled actuation of the switch by the drive when the control switch takes the latter switching position, and simultaneously the control signals carry out signal exchange at the inputs. The control switch is a disk switch.
