Abstract (en)  
A connector is provided in which a connector member is secured to a case and a shielding effect can be maintained even if a mating plug-type connector to be engaged therewith has a flat insulating plate with connecting portions on both of its faces, forming mutually parallel arrays of pluralities of upper terminals and lower terminals, which are strips of conductive segments. The connector member and the case are included. The connector member includes an inner shield cover that includes engaging portions having press-fractured faces, formed in its rear end. The case has resin springs which are disposed inside the tube-shaped portion of the case and extend toward the back and fixing stops which are disposed at free ends of the resin springs and increase in thickness inward from back to front. When the connector member is inserted from the back of the case, the resin springs are elastically opened out, and when the connector member is inserted until the fixing stops reach the engaging portions, the resin springs restore their original states, and the fixing stops engage with the engaging portions of the inner shield cover.
