Abstract (en)  
[origin: WO2012045512A1] The invention relates to an outsole, in which in the heel and ball regions (1a, 1b) several elements (2a, 2b) protrude downward with respect to a stop surface (3) which surrounds said outsole on all sides, which elements can be deformed vertically and/or horizontally to all sides by the forces acting thereon during walking until they are aligned with the stop surface (3). According to the invention, at least two groups of elements (2a, 2b) are provided, wherein with respect to the elements of a first group (2a) a force that is at least 10 N higher is required than with respect to the elements of a second group (2b) in order to bring said elements into alignment with the stop surface (3) by way of vertical deformation, and wherein with respect to the elements of the first group (2a) force that is at least 5 N lower is required than with respect to the elements of the second group (2b) in order to bring said elements into alignment with the stop surface (3) by way of horizontal deformation.
