Abstract (en)

[origin: WO2012045579A1] A rotary printing press (1, 10) and a method for monitoring characteristic values of the printing medium which is applied to the printing material (4) are described and claimed. It is presented as novel and inventive that a sensor station (7, 8, 21) has at least one first pressure body (11) which can be brought into contact with the printing material (4) in the region of the applied printing medium, and that the sensor station (7, 8, 21) has sensors (13, 29), by way of which measured values can be recorded which come from constituent parts of printing media which are in contact with the at least one first pressure body (11) and/or have been removed from the printing-material web (4) by the at least one first pressure body (11).
