Abstract (en)
[origin: WO2012045589A1] In the case of an outside door handle device which has a handle carrier (16) which can be fastened to the inside of the door (17) and a handle unit (4) resting on the outside of the door (2), a solution is intended to be found, in which a reliable outside door handle device is provided in a structurally simple manner and cost-effectively, said outside door handle device being able to be handled conveniently and rapidly for installation and removal and permitting reliable fixing to the handle carrier. This is achieved in that a locking means (24) which interacts with a tower element (6) in the manner of a bayonet connection is arranged on the handle carrier (16) so as to be rotatable between a release position releasing a movement of the tower element (6) and a locking position blocking the movement of the tower element (6), a manipulation element (28) is provided, with the aid of which the locking means (24) is rotatable at least between the release position and the locking position and is lockable at least in the locking position, the handle carrier (16) has at least two engagement parts (29, 30) in which the one manipulation element (28) can be accommodated in an adjustable manner, and an access space (31, 32) is formed for each of the at least two engagement parts (29, 30), the access space being formed in the handle carrier (16) and allowing unhindered access to the accommodated manipulation element (28).
