Abstract (en)  
[origin: WO2012045390A1] The invention relates to a release bearing arrangement, comprising a release bearing having an inner ring and an outer ring, wherein a radially inwardly extending sealing element is provided on the outer ring and is rotationally fixed thereto, said sealing element sealing the inner ring or a component connected thereto, wherein the sealing element (8) forms a gap-type seal to a component connected to the inner ring (3) in the region of the outer edge of said sealing element and the sealing element (8) has, at least in sections, a circumferential surface structuring at the outer circumference of said sealing element, by means of which contaminants present during rotation of the outer ring (4) and hence of the sealing element (8) are conveyed radially outwards.
