Abstract (en)

[origin: WO2012045941A1] The invention relates to a method for executing a plurality of interdependent tasks in a multitasking system, including the following steps: associating a logic-time vector (H) with each task (T), said vector indicating the dependencies of the task with respect to a set of other tasks (Ta), and defining a partial-ordering relation on the set of logic-time vectors, such that a subsequent task, which depends on the execution of an occurrence of a preceding task, has a vector greater than that of the preceding task; executing the task (T) unless the vector thereof is greater than the vector of any one of the other tasks (Ta); and updating the vector of a completed task (T) to reflect the dependencies of a new occurrence of the completed task.
