Abstract (en)

[origin: EP2626479A2] The component has a partition plate (1), where a reinforcement element (3) passes through the separation plate. The partition plate has a through opening (1d) for the reinforcement elements, where a trough-shaped shell body (6) of the partition plate is formed in the region of the opening. The reinforcement element proceeds and starts from one of two building sections (A,B) and projects at the through opening into the shell body. The reinforcement element cooperates with an insulating element (5) for sound-insulated power transmission between the two buildings.
