Abstract (en)
[origin: WO2012049166A2] The invention relates to a closing element for a machine frame of a rolling press, that sits on the end of a frame element as a hasp. According to the invention, the closing element comprises means enabling a pendular motion on the frame element. In this way, a floating mounting of the closing element is achieved. This enables a very fast dismounting that facilitates the replacement of the rolls, and leads to an optimum arrangement of the closing elements on corresponding end pieces of the machine frame.
