Abstract (en)
[origin: EP2629024A2] The flue (10) has an inflow port (18) for suctioning air, and an exhaust device (19) generating air barrier extending in environment space. The exhaust device is arranged above, below and/or laterally adjacent to the inflow port, and a ventilation device i.e. ventilator, is provided for suction and/or acceleration of air e.g. ambient air or supply air, from a supply air device. A heating device heats air provided to the exhaust device, and arranged between the ventilation device and the exhaust device. A control device controls the exhaust device, ventilation device and/or the heating device. An independent claim is also included for a method for suction of gaseous medium with a flue.
