Abstract (en)

[origin: WO2012052653A1] The invention relates to an appliance comprising a securing housing (1) and receiving a cover (2) that is hinged in such a way that it closes when lifted, and a module (3) receiving a strip of rolled-up precut material. Said module (3) comprises a flap (11) hinged in relation to the module and a device (D) authorising a pull on the end of the strip of material. Said module comprises means for enabling the positioning and articulation of a flap (11) arranged facing the inner face of the cover and a supporting plate (3e) of said device (D). The device (D) comprises a vertically arranged tappet (17) that slides in a controlled manner and in such a way that it is limited in relation to the inner face of the supporting plate (3e). The tappet comprises a low contact and grip part (17.1), and an upper end (17.2) forming a cam. The device (D) comprises a rolling means (20) co-operating with the upper end of the tappet. The tappet co-operates with the flap. The device (D) acts on the flap (11) in order to ensure that it pivots towards the rear, enlarging the space (V) between the flap and said inner wall (2.1) of the cover, in order to authorise the stripping and removal of the strip of material from the appliance.
