Abstract (en)
[origin: WO2012052957A1] A binding machine for binding blocks (B) of sheet elements (F) comprises a supporting base defining a horizontal plane (p), handling means (3) for handling one block (B) which have a lateral abutment surface (4) for a first side face (F1) of the block (B), longitudinal guide means (5) for slidably guiding the handling means (3) between a first end position (6) for engaging the block (B) to be bound and a second end position (7) for releasing the bound block (B), a distribution head (8) for distributing an adhesive to the back (D) of the sheet elements (F). The lateral abutment surface (4) is inclined at a first angle (a) of predetermined value to the horizontal plane (p) at least at the second end position (7).
