Abstract (en)

[origin: WO2012052452A2] A stopping arrangement of refrigerator shelf is disclosed in the utility model. The stopping arrangement comprises a refrigerator shelf (1) which is provided with a slide channel (151), wherein the slide channel is configured for mating with a slide rail on an inner shell of a refrigerator; and a stop (23) which is provided on the inner shell of the refrigerator and located proximate to the slide rail on the inner shell, wherein the movement of the refrigerator shelf (1) is limited by the stop (23) when the slide channel of the refrigerator shelf (1) is moved to the stop (23) along the slide rail. Through being provided on the inner shell, the stop can come into contact with the slide channel when the refrigerator shelf is drawn outwardly, which prevents the refrigerator shelf from being drawing out un-obstructively. The refrigerator shelf can be drawn out through lifting up a front edge of it and causing the slide channel to pass across the stop. Because there is no stop on the refrigerator shelf, a simple and good appearance, a convenient manufacturing process and a reliable configuration are obtained. A refrigerator comprising the stopping arrangement the refrigerator shelf mentioned above is also disclosed.
