Abstract (en)

[origin: EP2631412A2] The device has an elastic hollow body i.e. hose, inserted into an edge of a flexible web i.e. cloth e.g. awning cloth, where the hose is made of elastic deformable material. A cross-section of the hollow body is larger than width of a longitudinal slot (3) and smaller than a cross-section of an undercut area of a profile (1). The body is guided into the undercut area of the profile by pressing together over the longitudinal slot. A solid body i.e. bar, partially filling a cavity of the hollow body is inserted into the hollow body.
