Abstract (en)

A load-holding valve (1) comprises: a body (2) provided with a plurality of openings (3, 4, 5) through which a pressurised fluid can enter, or exit, the valve (1); a main piston (30); throttling means (50) intended for being traversed by the pressurised fluid; the valve comprises piloting means (10) that can alternatively assume an open configuration (O), in which the piloting means (10) enables a portion of pressurised fluid to pass into a piloting chamber (68) for moving the main piston (30) along a direction (X) that is substantially parallel to a longitudinal axis (A), and a closed configuration (I) in which the piloting means (10) prevents the passage of the fluid and the main piston (30) is moved in the direction (X) by the pressurised fluid that reaches the piloting chamber (68) after traversing the throttling means (50).
