Abstract (en)

[origin: WO2012055052A1] The device (4) for clamping a fixture attachment (19) to a machine comprises tension rods (20) for fixing the fixture attachment to an adapter piece (21) attached to a machine part, whereby the adapter piece (21) is provided at one side of the tension rods with at least a guiding means (22) cooperating with a matching groove (23) at the fixture attachment (19). On the other side of the tension rods a guide bar (24) is arranged operating with a matching groove (25) in the fixture attachment. Providing the fixture element with a guiding means, which can have a prismatic or rectangular end enhances on the one hand the precision of the clamping and of the position of the workpiece within the machine and gives on the other hand the customer the choice to introduce the fixture element in one orientation only or in both orientations under the adapter piece.
