Abstract (en)
[origin: EP2634333A2] The lock has a tightening element and a locking element, which are arranged directly adjacent to each other. The direction of movement and the path of movement of the tightening element and the locking element are equal. A locking edge and a tightening edge are the sections of an edge of a recess of a locking plate. The tightening element and the locking element are independently moved out of a lock case, where the tightening element and the locking element mounted concentrically to each other. The tightening element has a tightening slope moveable along a pulling edge of the locking plate.
