Abstract (en)

[origin: EP2634346A2] The rail (61) has a running surface (65) for supporting a wheel tread surface (55) of running rollers (51, 52) of a sliding leaf e.g. window leaf or door leaf. Running surface width (l) depends on a profile spacing (p) of guide rail profiles (10, 20) to each other such that the sliding leaf is movably mounted in center between the guide rail profiles. The running surface width is larger than the profile spacing. A collar stop unit (66) is provided for a flange (56) of the running rollers. A lateral guide surface (67) is formed for a lateral guide roller (53) of the sliding leaf. An independent claim is also included for a method for manufacturing a sliding leaf suspension.
