Abstract (en)

[origin: EP2634355A2] The reverse gear has a winder (3) that is incorporated around a rotary axis co-rotating around a winding shaft, where a winding section is provided for rolling and unrolling a lift tape (2). A rotating rod holder is incorporated axially next to the winding section co-rotatable on the winder. A position adjusting device is actuated from outside of a housing (1), where one of stoppers of a stopper assembly is arranged on an adjusting element. The adjusting element is placed on a housing wall section. An independent claim is included for a building opening shading device, particularly a venetian blind.
