Abstract (en)
Method for use in a decentralized electronic transfer system, the method comprising the steps of: - Generating a first digital code representing a first transaction from a first user's secure repository to the first user's unsecure repository; - Sending the digital code to a secure storage memory related to the unsecure repository to be stored in an area of the memory; - Generating by a processor related to the unsecure repository a second digital code representing a second transaction from the unsecure repository to the second user's repository; - Connecting the processor to the internet; And the subsequent steps of: - Retrieving by the processor the first digital code stored in the secure storage memory; - Publishing by the processor via the internet connection of the retrieved digital code to validate the first transaction; - Publishing by the processor via the internet connection of the second digital code to validate the second transaction.
