Abstract (en)

[origin: EP2634785A1] The device (10) has a switching unit arranged inside a housing (20) that comprises an openable housing cover (22). A control lever head (42) of a control lever (40) for switching the switching unit projects through a switching opening (24) and is movable between an on-position (E) and an off-position. An opening contour of the opening and an outer contour of the control lever head are aligned with one another such that the control lever head prevents and permits a movement of the cover via the head in the on-position and the off-position, respectively. An independent claim is also included for a method for opening a housing cover of a switching device.
