Abstract (en)

[origin: EP2635047A2] The method involves testing the auditory sensory memory of a user of a hearing device, where a test result is obtained, where the hearing device is set depending on the test result. A retentivity is investigated regarding an interaural time difference or level difference during the testing. A discrimination test is executed before the testing of the auditory prediction memory. A directionality or a binaural signal processing of the hearing device is adjusted on the basis of the test result. An independent claim is included for an adjusting device with a testing unit.
