Abstract (en)
[origin: WO2012059566A1] A slicing machine (10) having a rotating circular cutter (12), which is mounted in the machine housing (11), a slide (14), which carries a supporting plate (13), is guided by means of a slide foot (14a) along a sliding rail (15c) parallel to the cutting plane (E) and can be moved parallel to the supporting plate, and also a device (18) for setting the cutting thickness with a stop plate (18a), wherein the slide foot is locked or released for a tilting movement of the slide foot by means of a first push rod (17a), which interacts with a plate cam (17b) for adjusting the stop plate, is characterized in that the first push rod acts on a locking disc (17c), which is rotatably mounted on the sliding rail and has a control contour, which interacts by means of a second push rod (17d), which extends through the separating wall, with the plate cam for releasing or locking a tilting movement of the slide foot, and in that a separating wall (16), running between the supporting plate and the slide foot, encloses a guiding space (F), in which the sliding rail is arranged. This allows more reliable safety locking of the cutter and a high level of protection from splashed water and improves hygiene during operation and handling during cleaning.
