Abstract (en)

[origin: WO2012059320A1] An apparatus for controlling vehicle entry to and/or exit from a space comprising: - at least a first barrier device comprising at least a first moving barrier element and first actuator means to reversibly move said first barrier element between a first operating position, in which the first barrier element obstructs transit along a first transit lane to/from said space, and a second operating position, in which the first barrier element allows transit along said first transit lane; and - at least a second barrier device comprising at least a second moving barrier element and second actuator means to reversibly move said second barrier element between a first operating position, in which the second barrier element obstructs transit along a second transit lane to/from said space, and a second operating position, in which the second barrier element allows transit along said second transit lane. At least the first barrier device comprises a first control module, provided with a first user interface, accessible to a user travelling along the second transit lane. The aforesaid first control module is adapted to send first control signals to the second barrier device to activate at least the second actuator means of the second barrier device.
