Abstract (en)

[origin: WO2012062585A2] The invention relates to a method for producing a part containing an embedded pattern of micrometric dimensions at most. The invention comprises the following steps consisting in: preparing first and second substrates of which at least one is transparent, at least one trench being provided in at least one of said substrates and extending from a surface that is intended to be glued to the other substrate; gluing the first and second substrates together by means of molecular adhesion, said at least one trench defining a hollow space (36) configured to define the embedded pattern, said hollow space communicating with the exterior of the assembled first and second substrates; and subsequently making a colouring fluid flow through the hollow space at least temporarily, in order to colour at least some walls.
