Abstract (en)

[origin: WO2012062865A1] The present invention relates to an attachment means and an apparatus for lifting heavy loads P by means of a lifting means H in the form of a sling or strap. The attachment means according to the invention can be produced inexpensively and has a sufficient load bearing capacity with a low material requirement. This is achieved by virtue of the fact that the attachment means comprises: a contact part (2), which has a contact section (6) with a length L6, measured in the longitudinal direction L of the attachment means (1), which corresponds to at least the width B of the lifting means H, said contact section having a contact surface (7) on which, during practical use, the lifting means H rests, and two attachment sections (8, 9), of which in each case one is integrally formed on one of the ends of the contact section (6) and which are provided for attaching a hoist Z for coupling the attachment means (1) to a lifting device, such as a crane; and a bracing part (3), which serves to brace the contact part (2), is fixedly connected to the contact part (2) and extends at least over the length L6 of the contact section (6) of the contact part (2).
