Abstract (en)
[origin: WO2012062714A1] The invention relates to a heat exchanger (100) providing a heat transfer between a first fluid and a second fluid. The heat exchanger (100) comprises a stack of plates (124) including a last plate (124) and a second-to-last plate (124) together defining an end chamber (126c), said last plate (124) being provided with at least an inlet for the second fluid (121) and an outlet for the second fluid (122). The stack of plates (124) defines an inlet passage for the second fluid (130) and an outlet passage for the second fluid (131). The end chamber (126c) houses a channelling means (127) comprising an inlet flow channel (128a) that can be used to channel the second fluid between the inlet for the second fluid (121) and the inlet passage for the second fluid (130) and an outlet flow channel (128b) that can be used to channel the second fluid between the outlet for the second fluid (122) and the outlet passage for the second fluid (131).
