Abstract (en)

A process is described for producing a transpiring insole (1) comprising the steps of: making a net-type supporting structure (2) of the insole (1) by casting elastomeric foamed material, through a die equipped with inserts adapted to make through-holes (3) in the net-type supporting structure (2), wherein the net-type supporting structure (2) is cast onto a layer (5) made of natural transpiring material; and coupling a layer (7) for bearing a foot to the layer (5) made of natural transpiring material, the bearing layer (7) being coupled to the layer (5) on the opposite side of the layer (5) with respect to the side to which the net-type supporting structure (2) has been cast or glued. An insole (1) produced through such process is also described.
