Abstract (en)

[origin: EP2639656A1] The case has a watch mechanism whose control device comprises an intermediate rocker (36) intended to be interposed between a push rod (22) and a control lever of the mechanism. The rocker is arranged to present a movement of rotation axis (X1), and includes an actuation finger (40) intended to operate the lever in response to action of a user. The rocker has a bearing surface (34) arranged opposite to the rod. The rod exerts pressure on the surface in response to the user's action. The surface is located between the axis and the finger.
